

Support Guide

FedEx - Version 8.3.0

Prepared for support enablement

Release Lane	FedEx - Version 8.3.0
Plugin Version	8.3.0
Primary Audience	Support, QA, and customer-facing operations teams

Release Summary

This release is a broad FedEx stability and usability update covering edit-order reference handling, UK-shipment ETD safety, keyboard accessibility, SmartPost validation, bulk printing, product-bundle compatibility, deleted-product fatal-error protection, duties-and-taxes quote handling, and declared-value calculations. The support impact is meaningful because several of these changes convert fragile or confusing scenarios into clearer, safer behaviors.

What Changed

- **Customer reference behavior on Edit Order:** Customer reference type and value handling is improved for per-order behavior on the Edit Order page, helping support diagnose label and reference mismatches more consistently.
- **ETD auto-disable for unsupported UK shipment route:** ETD is now automatically disabled for the specific UK shipment scenario where it is not supported. This is not a general all-route ETD change; it is targeted to that UK shipment case to avoid invalid document-processing behavior.
- **Keyboard accessibility improvements:** The Add Package and Start Tracking buttons are improved for keyboard accessibility, which helps merchants using keyboard navigation and supports better usability compliance.
- **SmartPost single-package guard:** The plugin now adds a guard for SmartPost REST shipments that should be limited to a single package, preventing invalid multi-package behavior in unsupported cases.
- **Bulk print library error handling:** Bulk print flow resilience is improved to address library-related failures during batch label printing.
- **Product bundle compatibility:** FedEx flows are updated to behave more reliably when bundled products are involved in shipment or packaging logic.
- **Deleted-product fatal error protection:** Generate Package and Create Shipment flows now avoid fatal errors when an order contains a product that has been deleted from the catalog.
- **Duties and taxes quote request enhancement:** The rate request now includes `edtRequestType` for duties-and-taxes shipping quotes in REST mode, improving quote accuracy or compatibility in those scenarios.
- **Declared value tax handling:** Declared value calculation is corrected when the Exclude Tax setting is enabled so tax is not incorrectly included.

Customer Impact

- Merchants should encounter fewer hard failures in package creation, shipment creation, and printing flows.
- The specific UK shipment scenario covered by this release should behave more safely because ETD is disabled only where that route does not support it.
- Tax-sensitive declared value behavior should be more accurate when stores use Exclude Tax settings.
- Accessibility and edit-order usability are improved, which can reduce friction for support-assisted admin workflows.
- SmartPost and bundled-product scenarios should now fail less often or be blocked more appropriately when the setup is unsupported.

Support Talking Points

- If a merchant reports a new block around ETD, explain that this release only targets the unsupported UK shipment case and is not a blanket ETD disable across all routes.
- If a merchant says a deleted product no longer crashes shipment actions, that is expected behavior from this release.
- If SmartPost shipments behave differently after the update, verify whether the order is trying to use multiple packages where only single-package behavior is supported.
- If declared value looks different after the release, check whether the store uses the Exclude Tax setting before treating it as a regression.
- If batch printing issues are reported, confirm whether they still reproduce after the bulk print library fix and gather the exact printing path used.

How Support Can Verify The Release

- Edit Order reference scenario: update customer reference type and value on an order and confirm the saved behavior is reflected correctly in shipment-related output.
- Unsupported UK shipment ETD scenario: reproduce the specific UK shipment case covered by the release and confirm ETD is automatically disabled there rather than causing downstream failure.
- Non-UK ETD sanity scenario: confirm ETD behavior remains normal on other supported routes and is not disabled broadly.
- Keyboard accessibility scenario: navigate to Add Package and Start Tracking controls using only the keyboard and confirm both controls are reachable and usable.
- SmartPost scenario: attempt a SmartPost REST shipment with multiple packages and confirm the plugin prevents unsupported behavior clearly.
- Bulk print scenario: run bulk label printing and confirm labels generate without the prior library-related failure path.
- Deleted product scenario: use an order containing a deleted product and confirm Generate Package and Create Shipment do not fatal-error.
- Duties and taxes quote scenario: run a REST quote flow where duties and taxes apply and confirm the quote request behaves correctly.
- Declared value scenario: enable Exclude Tax and confirm declared value no longer includes tax unexpectedly.

Expected Scenarios

- **Merchant says ETD disappeared on some shipments:** Check whether the order matches the specific UK shipment case covered by this fix. This release is targeted and should not disable ETD generally on unrelated supported routes.
- **Merchant sees different declared value totals:** Verify the store tax setting and whether Exclude Tax is enabled. The release corrects declared value behavior in that configuration.
- **Merchant cannot create a SmartPost shipment with multiple packages:** Explain that the release adds a guard for unsupported multi-package SmartPost REST behavior and verify whether the shipment should be split or reconfigured.
- **Merchant had product catalog cleanup and shipment actions now behave differently:** Confirm whether the order contains deleted products. The release prevents fatal errors and may now surface safer handling instead of crashing.
- **Merchant reports bulk print issues:** Confirm whether the issue still reproduces in v8.3.0, and gather whether the failure is in batch printing specifically versus individual label printing.

Escalation Guidance

- Escalate if ETD is disabled outside the intended UK shipment case or if it is not disabled in the targeted UK case when it should be.
- Escalate if declared value still includes tax when Exclude Tax is enabled and the order totals clearly show the mismatch.
- Escalate if Generate Package or Create Shipment still fatal-errors in deleted-product scenarios after the upgrade to v8.3.0.
- Escalate if SmartPost valid single-package orders are blocked incorrectly.

- Escalate if bulk printing still fails reproducibly after verifying the issue is not environment-specific.
- Include order IDs, screenshots, shipment type, UK-route confirmation where relevant, REST mode confirmation, tax settings, package count, and exact steps to reproduce.
