

FedEx Shipping Plugin for WooCommerce Support Guide

FedEx Release - v8.4.0 | Generated June 16, 2026

Release Lane	FedEx Release - v8.4.0
Plugin Version	v8.4.0
Primary Audience	Customer support, QA, and implementation teams

Release Summary

- This release expands customs and invoice controls for international shipping, especially around tax identifiers, importer details, commercial invoice fields, and currency handling.

Included Release Items

- Added an option to use the order currency for customs and declared value on individual orders, with the setting now available under Advanced settings.
- Consignee / Billing Tax ID at Checkout — collect customer VAT/EORI/TIN
- Importer of Record for International Shipments
- Order-Level Commercial Invoice Fields — Purpose, Comments & Special Instructions
- Currency Conversion Rounding Causing Declared Value to Exceed Customs Value

What Changed

- A new advanced option allows order currency to be used for customs and declared-value handling on individual orders.
- Checkout can now collect consignee or billing tax identifiers such as VAT, EORI, or TIN when merchants need them for compliance workflows.
- Importer-of-record handling was added for international shipments that require a distinct importing party.
- Order-level commercial invoice fields now support purpose, comments, and special instructions.
- Currency-conversion rounding was corrected so declared value does not exceed customs value because of conversion math.

Customer Impact

- International merchants should have more complete customs data available before label generation.
- Stores shipping across borders may see fewer manual edits to invoice and customs details.
- Merchants using different order currencies should see more consistent declared/customs values.

Support Talking Points

- If a merchant wants customs amounts to follow order currency, direct them to the new advanced setting and confirm the order-level expectation.
- If a merchant asks where to collect VAT, EORI, or TIN, explain that checkout support now exists for consignee or billing tax IDs.

- If customs paperwork requires an importer different from shipper or recipient, verify whether Importer of Record is now configured.
- If merchants ask for more invoice context, point them to the order-level commercial invoice fields for purpose, comments, and special instructions.
- If declared value previously exceeded customs value by a small amount, note that rounding behavior was corrected in this release.

How Support Can Verify The Release

- Place an international test order in a non-default order currency and confirm customs/declared values follow the configured behavior.
- Confirm tax-ID fields can be collected and passed when a checkout flow requires VAT, EORI, or TIN.
- Create an international shipment that uses Importer of Record and verify the related details appear in the shipping workflow.
- Populate purpose, comments, and special instructions on an order and verify they appear in the commercial invoice flow.
- Check a currency-conversion case that previously over-rounded declared value and confirm the values now stay aligned.

Expected Scenarios

- A merchant ships internationally and needs customs values in the same currency as the order.
- A store must collect customer tax IDs for regulatory or clearance requirements.
- An importer is legally different from the shipper or receiver on the order.
- The merchant needs shipment-specific invoice instructions beyond default product data.

Escalation Guidance

- Escalate if customs values still exceed expected limits after confirming currency settings.
- Escalate if tax-ID data is collected at checkout but does not reach the shipment workflow.
- Escalate if Importer of Record or invoice fields fail to appear on the generated documentation.
