

Support Guide

Multi-Carrier Release - v 3.2.5

Prepared for support enablement

Release Lane	Multi-Carrier Release - v 3.2.5
Plugin Version	3.2.5
Primary Audience	Support, QA, and customer-facing operations teams

Release Summary

This release addresses the use of a deprecated function in the Multi-Carrier plugin. The support impact is mainly preventive: the update helps keep the plugin compatible with modern WooCommerce and WordPress environments and reduces the chance of warnings, notices, or future breakage tied to outdated function usage.

What Changed

- **Deprecated function usage fix:** The plugin is updated to stop relying on a deprecated function. This improves forward compatibility and reduces the risk of environment-specific warnings or failures as the platform stack evolves.

Customer Impact

- Most merchants may not notice a visible UI change, but the update improves technical stability and compatibility.
- Stores running newer WordPress or WooCommerce versions should be less likely to encounter deprecated-function warnings tied to this code path.
- Support teams should see fewer compatibility concerns caused by outdated internal function usage.
- The release is primarily maintenance-focused, so behavior should remain familiar while reliability improves.

Support Talking Points

- If a merchant asks what changed in this release, explain that it is a compatibility and maintenance update rather than a feature release.
- If the merchant had warning logs or notices related to deprecated behavior, this update may be relevant even if the storefront experience looked normal.
- If a new issue appears after updating, do not assume it is caused by this release item unless it is clearly connected to compatibility or warning behavior.
- If the store is on newer platform versions, this release is a good update to keep the plugin aligned with the environment.

How Support Can Verify The Release

- Sanity scenario: confirm the plugin loads normally and key Multi-Carrier workflows still behave as expected after updating to v3.2.5.
- Compatibility scenario: test the plugin on the target WordPress and WooCommerce versions and confirm there are no new deprecated-function notices tied to this release item.
- Logging scenario: review debug or PHP logs and confirm the previous deprecated-function warning no longer appears in the affected flow.
- Regression scenario: verify standard rate, shipment, or related plugin flows continue to work without functional change.

Expected Scenarios

- **Merchant asks whether this is a feature update:** Explain that it is primarily a maintenance and compatibility release focused on deprecated function usage.
- **Merchant had warning logs before update:** Ask for the prior warning details and confirm whether they stop appearing after moving to v3.2.5.

- **Merchant reports no visible difference:** That can be expected because this release is meant to improve underlying compatibility rather than add a new merchant-facing feature.
- **Merchant reports a new unrelated issue after update:** Treat it as a separate investigation unless the evidence points directly to compatibility changes in the affected code path.

Escalation Guidance

- Escalate if deprecated-function warnings still appear reproducibly after updating to v3.2.5.
- Escalate if the compatibility fix introduced a new functional regression in a standard Multi-Carrier workflow.
- Escalate if logs indicate a different deprecated-function path that is still active and reproducible.
- Include plugin version, WordPress version, WooCommerce version, affected workflow, and the exact warning or log output.
