

Support Guide

Post Nord - Version 1.3.2

Prepared for support enablement

Release Lane	Post Nord - Version 1.3.2
Plugin Version	1.3.2
Primary Audience	Support, QA, and customer-facing operations teams

Release Summary

This release adds more control over where tracking messages appear in emails and updates the PostNord tracking URL behavior. The support impact is primarily around customer communication: merchants now have better placement control for tracking content, and tracking links should direct customers more reliably to the intended tracking destination.

What Changed

- **Tracking message position setting:** A new setting lets merchants control where the tracking message appears in email content. This gives support a clear configuration point when merchants want the message displayed earlier, later, or in a more suitable part of the email.
- **Tracking URL update:** The plugin now uses an updated PostNord tracking URL. This should improve the customer tracking-link experience and reduce cases where older tracking links do not match current PostNord expectations.

Customer Impact

- Merchants can now adjust tracking-message placement to better fit their email layout and customer communication style.
- Customers receiving shipment emails should be sent through the newer tracking-link flow instead of an older URL pattern.
- Support requests about tracking message visibility may now be resolved through configuration rather than custom workarounds.
- Existing email templates or custom styling may need a quick verification pass after the setting is changed.

Support Talking Points

- If a merchant says the tracking message is in the wrong place, first check the new tracking-message position setting before treating it as a bug.
- If a merchant says tracking links look different after the update, explain that the release includes an updated tracking URL path.
- If tracking content appears missing, confirm the shipment actually has tracking data and then verify the new placement setting in the plugin configuration.
- If a merchant uses heavily customized email templates, verify whether the new message position interacts with template overrides or email-builder customization.

How Support Can Verify The Release

- Tracking message position scenario: change the tracking-message placement setting and send a test tracking email. Confirm the message appears in the selected position.
- Default email scenario: leave the plugin in a normal configuration and confirm a standard shipment email includes the tracking message in the expected location.
- Tracking URL scenario: click the tracking link from a shipment email and confirm it opens the updated PostNord tracking destination successfully.

- Template compatibility scenario: if the store uses customized WooCommerce email templates, verify the tracking message still appears cleanly without layout breakage.

Expected Scenarios

- **Merchant wants the tracking message moved:** Guide them to the tracking-message position setting and have them test the desired placement with a fresh shipment email.
- **Merchant says the tracking link changed:** Explain that the plugin now uses an updated PostNord tracking URL and confirm the new link resolves correctly.
- **Customer cannot find tracking details in the email:** Verify shipment tracking exists, then check whether the message placement setting or email-template customization is affecting visibility.
- **Merchant reports formatting issues after update:** Check for custom email-template overrides or CSS adjustments that may need minor updates around the new placement behavior.

Escalation Guidance

- Escalate if the tracking message does not appear despite valid tracking data and a supported placement setting.
- Escalate if the updated tracking URL resolves incorrectly or produces a reproducible broken-link flow.
- Escalate if changing the tracking-message position causes consistent layout issues in a standard, non-customized WooCommerce email setup.
- Include the plugin version, screenshot of the email, the selected tracking-message position, sample tracking number, and whether custom templates are in use.
