

UPS WooCommerce Shipping v6.5.1

Support Guide | Release date: May 28, 2026

Release Lane	Plugin Version	Primary Audience
UPS Release - v6.5.1	6.5.1	Support, QA, Customer-facing teams

Release Summary

Version 6.5.1 contains two completed items from the Trello release lane: a performance and security improvement for admin notices, and a new developer customization layer for UPS delivery-confirmation and service-option behavior. The release is low-risk for standard stores because existing behavior remains unchanged unless a merchant or developer intentionally adds custom code using the new hooks.

What Changed

1. Admin notice optimization and sanitization.

- The plugin no longer performs unnecessary database writes on every WordPress admin page load when there are no UPS notices to display.
- Notice messages are now sanitized before rendering in the browser, reducing the risk of unsafe HTML output.
- The existing one-time notice behavior remains intact, including environments that use object caching such as Redis or Memcached.

2. New developer hooks for delivery confirmation and service options.

- New hooks were added: `ph_ups_delivery_confirmation`, `ph_ups_package_service_options`, and `ph_ups_shipment_service_options`.
- These hooks allow developers to override signature requirements and related UPS service options using a code snippet, without changing the plugin core.
- The customization path covers checkout rates, manual label creation from Edit Order, and auto-generated labels triggered by order status.

Customer Impact

Area	Before v6.5.1	After v6.5.1
Admin performance	Every admin page load could trigger idle UPS notice database writes.	UPS checks for queued notices first and skips database work when nothing needs to be shown.
Admin security	Notice content could be rendered without proper escaping.	Notice content is sanitized before display.
Standard merchant workflow	Existing delivery-confirmation settings worked through global, product-level, and Edit Order controls.	These same settings continue to work the same way unless a custom snippet is added.

Advanced custom logic	Customers needed core changes or limited workarounds for route- or order-specific signature rules.	Developers can now add rule-based overrides through supported hooks.
-----------------------	--	--

Support Talking Points

- If a customer is not using a custom code snippet, v6.5.1 should behave like the earlier release from a shipping-workflow perspective, with the added benefit of cleaner admin notice handling.
- If a customer asks why signature behavior changed only for certain routes, order values, or destinations, check whether they added a snippet through WPCode or Code Snippets using the new developer hooks.
- The new hook capability is intended for advanced customizations such as forcing Signature Required for high-value orders, removing signature for Canada, or applying Adult Signature to restricted states.
- For support conversations, describe the hook feature as opt-in developer customization rather than a merchant-facing setting added to the plugin UI.

How Support Can Verify The Fixes

Admin notice fix

- Open Products, Orders, WooCommerce Settings, and UPS plugin settings without performing any UPS action first.
- Confirm no unexpected UPS notice banners appear.
- Generate a shipment or cancel an existing shipment and confirm the appropriate notice appears once, then does not reappear on the next admin page load.

Developer-hook feature

- Without a snippet installed, confirm checkout rates and label generation behave exactly as before.
- If a snippet is installed, generate a label that matches the snippet rule and confirm the expected signature level appears on the label.
- For log-based verification, go to WooCommerce > Status > Logs and review PluginHive-UPS-Error-Debug-Log for lines such as "UPS : Require Signature - 2" or "UPS : Require Signature - 3".

Expected Scenarios Support May Encounter

- **No-action admin browsing:** No UPS banner should appear when an admin simply opens dashboard pages and no shipment action has occurred.
- **Missing product weight or dimensions:** The plugin can show an order-level error notice when label creation is attempted with incomplete product shipping data.
- **Successful shipment creation:** A success notice should confirm the label is ready after shipment creation.
- **Successful shipment cancellation:** A success notice should confirm the cancellation completed and shipment can be re-initiated.
- **Route- or order-specific signature logic:** A custom snippet can intentionally override product, global, or Edit Order delivery-confirmation choices for matching shipments.

Escalation Guidance

- Escalate to engineering if unexpected UPS notices still appear on unrelated admin pages with no shipment activity.
- Escalate if a customer reports custom signature rules but cannot identify the snippet source; ask whether WPCode, Code Snippets, or custom theme/plugin code was added.
- Escalate if delivery-confirmation behavior differs between packages in the same multi-package shipment, because the release specifically validated consistent application across all packages.
- Escalate if WooCommerce logs show PHP warnings or errors after a custom snippet is installed.
