

UPS Shipping Plugin for WooCommerce Support Guide

UPS Release - 6.6.0 | Generated June 16, 2026

Release Lane	UPS Release - 6.6.0
Plugin Version	6.6.0
Primary Audience	Customer support, QA, and implementation teams

Release Summary

- This release covers invoice suppression for eligible EU shipments, checkout and label handling for signature and recipient TIN flows, Access Point block-checkout support, UI validation for per-package workflows, and additional handling support.

Included Release Items

- Skip Commercial Invoice for EU Shipments
- Signature requirement breaks domestic checkout rates and is missing from US↔Puerto Rico labels
- Access Point Locator: Block Checkout Support
- Recipient TIN: Block Checkout Support + Configurable Label
- Per-Package UI Redesign: Complete UI/UX Testing
- Additional Handling Indicator

What Changed

- Commercial invoices are skipped for eligible EU shipments where they should not be produced.
- Signature-requirement handling was updated for domestic checkout rates and US to Puerto Rico label scenarios.
- UPS Access Point Locator support was extended to WooCommerce block checkout.
- Recipient TIN support now covers block checkout and configurable label handling.
- The per-package UI redesign was validated for workflow and usability coverage.
- Additional Handling indicator support was added where relevant.

Customer Impact

- EU merchants should avoid unnecessary commercial invoices on shipments that do not require them.
- UPS signature options should behave more reliably during rating and label generation for the affected routes.
- Stores using block checkout gain better compatibility for Access Point and recipient tax workflows.
- Package-level workflows should feel clearer after the UI redesign validation.

Support Talking Points

- If a merchant expects a commercial invoice for an EU shipment, first confirm whether that route should now intentionally skip it.
- If domestic UPS rates disappear after enabling signature requirements, verify whether the order matches the previously affected scenario.

- If an Access Point option is missing in block checkout, confirm the store is actually using the blocks-based checkout flow.
- If a merchant needs a recipient TIN on the label, check both the block-checkout data path and the label configuration.
- If the package UI looks different, explain that the per-package experience was redesigned and validated in this release.
- If shipment requirements mention special handling, verify whether the new Additional Handling indicator is expected in that flow.

How Support Can Verify The Release

- Create an eligible EU shipment and confirm no commercial invoice is generated when it should be skipped.
- Test a domestic UPS checkout flow with signature requirement enabled and confirm rates still appear correctly.
- Test a US to Puerto Rico label flow and verify the expected signature behavior is present on the label.
- Use WooCommerce block checkout to verify Access Point selection appears and behaves correctly.
- Verify recipient TIN entry and label output in a block-checkout scenario.
- Walk through package-level configuration to confirm the redesigned UI remains clear and functional.
- Confirm Additional Handling is shown or transmitted in a shipment that requires it.

Expected Scenarios

- An EU merchant reports a missing invoice that is now intentionally suppressed.
- A UPS domestic shipment loses rates when signature requirement is enabled.
- A block-checkout store needs Access Point selection or recipient TIN support.
- A merchant needs extra confidence around package-level configuration after the UI update.

Escalation Guidance

- Escalate if EU shipments still generate unnecessary invoices after confirming route eligibility.
- Escalate if signature settings still remove rates or fail to appear on affected labels.
- Escalate if Access Point or recipient TIN support does not appear in block checkout despite valid setup.
- Escalate if Additional Handling is required but not reflected in the request or label output.
